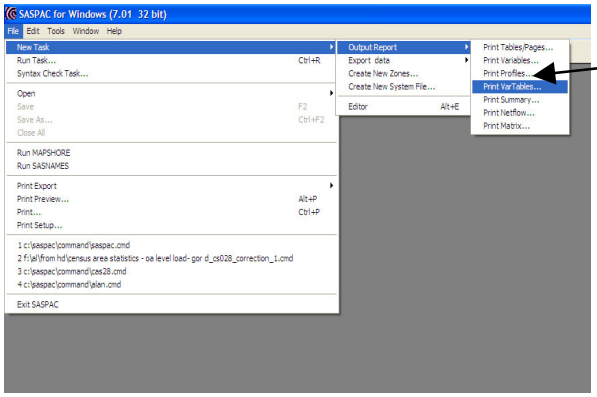
SASPAC Version 7.0
User Note 7.6

Print "VarTables"

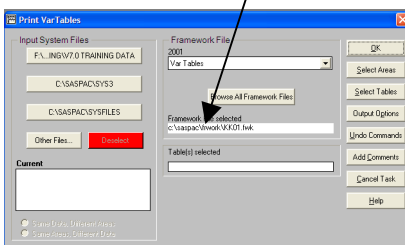
Introduction

This user note describes the method required to print Variable Tables ('Vartables') for the **Key Statistics** datasets, an alternative to the usual 'Print Tables' output. With this variation the geographic areas become the rows of the table, allowing variable counts for a number of different areas to be easily compared within one table.

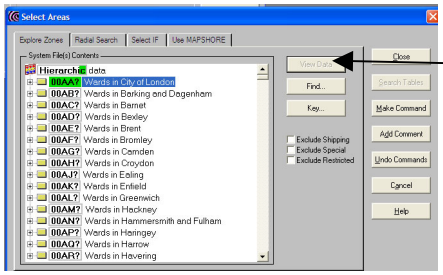
Methodology

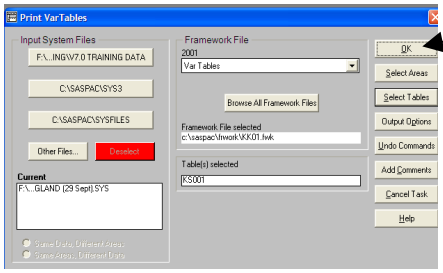


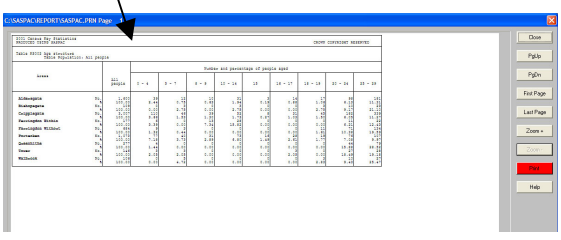
To run a 'Print VarTables' task select **'File/New Task/Output Report/Print VarTables....'** from the file menu. The familiar task window appears but you will notice there is only one framework file available entitled 'Var Tables'. On selection the default framework file 'KK01.fwk' is automatically selected.



Now the appropriate system file can be selected through the left-hand side of the window, remembering to select a Key Statistics dataset. Following this the **'Select Tables'** command can be used to search and select the table required (*User guidance note 7.4* can be referred to here to establish what tables are available for your area). Finally, the **'Select Areas/View data'** button is now used to select the areas you are interested in comparing, remembering to 'make command' before closing this window.





This completes the user defined selections and the task can now be run by selecting **'OK'**. Following a successful run **'Print Preview'** will display the table which can then be exported to other packages if required.


Areas selected are displayed as rows in the table.
